The Google wearable computer hardware is a headset attached to eyeglasses. I've tried them in the past, but never could fully look at the world as I did with a mirror hanging over my face. The problem was, and still is, that only the left side of the world is visible. What this allows is to have both the smartphone and Google Glass at the same precise location to provide photos or videos, but also to be able to share them. The image source, again, is the smartphone or tablet. With the Glass, some digital photo comparison software, like Lightroom, gives the option to "Zoom in", which, of course, also allows the user to see a different side of the photo. Good old Lightroom has been a practical standard for managing multiple images and it still has the keen eye of a top professional photographer. If I could eliminate a print shop from the equation, I'd be jumping for joy. Sharing digital images has become extremely simple over the years, and still continues to get better. I love the Interact feature in Lightroom, because I can recognize a digital photo within seconds. But what of sharing images on social networks? From time to time, I use the social network Pinterest, and it makes a great visual bookmarking tool. Pinterest is not a social network, per se, but the program uses a special algorithm to make sure that you can share images, that you might want to, but are not sure if they are "Pinterest compatible." Instead, you can pin them to the " Pinterest website .

Photoshop is great if you need to work on huge files and you want to build basic production workflow. It's also the most powerful tool for image manipulation and retouching. A majority of the tools are the same but you will have the more creative freedom when working with Photoshop, the larger files can not be saved in the RAW format, there is a new file size limit, and the learning curve is steeper. 933d7f57e6
